

KMM Property Maintenance

Website Rebuild

Spec build, not yet a closed paid contract

The Problem

Existing site ran on a locked-down builder that didn't allow any custom code. That meant the marketing team couldn't install tracking or analytics tools. No way to measure what marketing spend was actually working.

The Solution

A full rebuild using simple, standard web code, nothing that requires special software to edit later. One single file now controls tracking and analytics for the entire site. Real brand colors and logo pulled directly from the client's own business card. Added a before/after project gallery and a customer review system, neither existed before.

Homepage

Design and Feature Breakdown

The design choices behind the build, and why each one was made. This wasn't a template with the client's name swapped in.

01

SIMPLE, STANDARD WEB CODE: NOTHING EXOTIC

The old site's builder had no way to add custom code at all. That was the whole problem. The fix was to stop using a locked-down platform and build the site from the same basic building blocks every website is ultimately made of, instead of a more complex system that would need specialized software just to make a change. That choice means anyone on KMM's team, no coding background required, can open the site's files, read them like a document, and understand what's there.

- No complicated tools or setup required to make changes later
- Chosen specifically so a non-technical team can edit it safely
- Directly solves the one problem this project exists to fix

02

TRACKING SETUP: THE ACTUAL FIX

Every page on the site pulls its tracking and analytics setup from one single file. Right now that file is empty, with plain-English instructions written directly inside it. To add Google Analytics or a Meta (Facebook) ad pixel, someone edits that one file, once, and it takes effect across the entire site immediately. This one decision is the whole rebuild in miniature.

- One file controls tracking for the whole site, no page-by-page setup
- Comes with plain-English instructions already written in
- The direct answer to “our old site wouldn't let us track anything”

03

REAL BRAND IDENTITY, NOT A STOCK LOOK

Instead of picking a pre-made color scheme, the logo and colors were pulled directly from a photo of KMM's own business card. The navy, blue, and gold used throughout the site all trace back to that real, physical item, not a generic template. That's the difference between a site that could belong to any lawn care company and one that's unmistakably KMM's.

- Logo and colors traced back to the client's own business card, not a stock look
- Documented clearly so it stays consistent if someone else edits it later
- The difference between “a site that happens to be for KMM” and “KMM's site”

04

PORTFOLIO AND REVIEWS: TWO NEW FEATURES

Neither of these existed on the original site. The portfolio section lets a visitor click a “before” photo to reveal the “after,” a simple, visual way to show real completed work. The reviews section lets customers submit a review directly on the site, but nothing goes live automatically. Someone at KMM reads it first and approves it before it's shown publicly, keeping the door open for real testimonials without the risk of a fake one slipping through.

- Before/after photo gallery: 2 real completed jobs shown so far
- Customer reviews go through a simple approval step before they're posted
- Both are brand-new features, neither existed on the old site

Portfolio: before/after toggle

05

CONTACT FORMS: ALREADY WORKING, NOT JUST A MOCKUP

All 3 forms on the site (the free-estimate request, the contact form, and the review form) are already fully set up to work the moment the site goes live, with no extra setup step needed afterward. Each one also has a simple, invisible safeguard that automatically filters out spam bots before a submission ever reaches an inbox. Because of that, filling out any form on the site already feels complete when testing it, not like a placeholder waiting to be finished later.

- All 3 forms are ready to receive real submissions the moment the site is live
- A hidden spam filter blocks bots automatically, invisible to real visitors
- Forms already feel finished when tested, not like a placeholder

06

A DISTINCTIVE SEASONAL TOUCH, WITH A REAL DESIGN PROCESS BEHIND IT

A small visual detail that sets the site apart: gentle, drifting decorations near the edges of the screen (leaves, snow, flower petals, or dandelion fluff, depending on the season) that never cover the content and never get in the way of clicking anything. It automatically turns off for visitors whose devices are set to reduce on-screen motion, and it's disabled entirely on phones so it never feels cluttered on a small screen. It's also a good example of real revision, not a first attempt shipped as final. The winter snow effect was made heavier twice after feedback that it looked too light, an early version of the spring petals looked flat and was rebuilt with real shading and depth, and the summer dandelion fluff was originally drawn from the wrong angle and corrected after comparing it to an actual photo of a real dandelion seed.

- One single setting switches which season is showing, across the whole site
- Automatically turns off on phones and for visitors who prefer less motion
- Refined through several real rounds of feedback, not a first draft left as-is

07

CONTENT IMPROVEMENTS BASED ON REAL FEEDBACK

After an early review, feedback came back that the site's "Property Maintenance" service felt redundant

next to the other three. It was removed completely, not just from the main list, but from every dropdown menu, every footer, and every page description that mentioned it, so nothing was left half-updated. Gutter cleaning, which had been oddly listed under snow removal, was moved to lawn and garden care where it actually belongs, and the snow removal description was rewritten to specifically mention walkways, driveways, and parking lots. The whole change, from feedback to a fully updated site, happened in one sitting.

- A redundant service was removed everywhere it appeared, not just the one spot flagged
- A misplaced service (gutter cleaning) was moved to where it actually belongs
- Feedback to a fully updated, verified site: the same sitting

Why This Is a Strong Portfolio Piece

- Solves one specific, provable problem, not a vague “make it look nicer” request
- Shows real range beyond a template: an identity built from the client’s own branding
- Proves fast, thorough follow-through on feedback, reassuring for a client sizing up the process
